- Formalization of Tarski's Geometry:

Isabelle/HOL Petrović, Makarios (Euclidean and non-Euclidean model)

- HOL-Light Richter
- Other formalizations of geometry in Coq: Duprat, Guilhot

The problem

What are Hilbert's axioms?

- There are ten editions of the Foundations of Geometry.
- Hilbert's axioms are expressed in natural language: there is room for interpretation.

How to be sure that our formalization of the axioms is fine?

- The axioms are not contradictory (there is a model): our ADG 2012 paper.
- There are enough axioms to capture a set of geometric facts (descriptively complete): this presentation.

The usual argument

Tarski's axioms A1-A10

Hilbert's axioms Group I-IV

are bi-interpretable with the theory of Pythagorean ordered field.

are bi-interpretable with the theory of Pythagorean ordered field.

With this approach, the formalizations of both Hilbert's and Tarski-Schwabhäuser-Szmielew books are needed. This argument tells nothing about the neutral geometry $(A_1 - A_9)$.

Our approach

From Tarski to Hilbert:

From Hilbert to Tarski:

- an intermediate pier (*i.e.* an intermediate axiom system).
- two separate bridges

Overview

Braun-Boutry-Narboux (Unistra)

Overview

Braun-Boutry-Narboux (Unistra)

We separate the degenerate case of Pasch's axiom.

Allows to formalize some gaps in Euclid's Elements.

Tarski has a version expressed using betweenness and include degenerate cases:

Bet $A P C \land Bet Q B C \Rightarrow \exists X, Bet P X Q \land Bet B X A$

Hilbert has a version expressed using a disjunction and exclude the flat triangle.

Braun-Boutry-Narboux (Unistra)

Our 2012 formalization was correct but not descriptively complete.

The types of changes we made:

- Remove useless (dependent) axioms
- Add other axioms
- Rephrase some axioms
- Remove dependent types

- Given three collinear distinct points at least one of them is between the other two
- Uniqueness of segment construction
- Existence of parallel line

Hilbert does not say explicitly that:

forall A B C, BetH A B C -> A<>C

Hilbert has a binary relation between segments, we have a quaternary relation between points, so we need:

forall A B C D , CongH A B C D -> CongH A B D C

Lower Dimension Axiom:

There exists three non collinear points. Collinear := there exists a line such the three points belong to this line.

Problem

There are three non collinear points does no imply that they are distinct! There is a model of Group I-II with only one point and no lines.

Rephrased Lower Dimension Axiom:

There exists a point P_0 and line I_0 such that $P_0 \notin I_0$.

イロン イ理 とく ヨン イヨン

```
Dependent type = data + proof
```

Faithful to Hilbert's presentation, but hard to manipulate in Coq.

Example

```
Record Triple {A:Type} : Type :=
build_triple {V1 : A ;
V : A ;
V2 : A ;
Pred : V1 <> V /\ V2 <> V}.
```

Example of change of Type 4-5 A simplification

Axiom (IV-4)

Given an angle α , a half-line h emanating from a point O and given a point P, not on the line generated by h, there is a unique half-line h' emanating from O, such that the angle α' defined by (h, O, h') is congruent with α and such that every point inside α' and P are on the same side with respect to the line generated by h.

In 2012 we had "a little bit verbose" axiom III 4 for existence and uniqueness of angle construction:

aux : forall (h h1 : Hline), P1 h = P1 h1 -> P2 h1 <> P1 h; hcong 4 existence: forall a h P. ~Incid P (line of hline h) -> ~ BetH (V1 a) (V a) (V2 a) -> exists h1, (P1 h) = (P1 h1) /\ (forall CondAux : P1 h = P1 h1, CongaH a (angle (P2 h) (P1 h) (P2 h1) (conj (sym not equal (Cond h)) (aux h h1 CondAux))) /\ (forall M, ~ Incid M (line of hline h) /\ InAngleH (angle (P2 h) (P1 h) (P2 h1) (conj (sym not equal (Cond h)) (aux h h1 CondAux))) M -> same side P M (line of hline h))); hEq : relation Hline := fun h1 h2 => (P1 h1) = (P1 h2) /\ ((P2 h1) = (P2 h2) \/ BetH (P1 h1) (P2 h2) (P2 h1) \/ BetH (P1 h1) (P2 h1) (P2 h2)); hline construction a (h: Hline) P (hc:Hline) H := (P1 h) = (P1 hc) /CongaH a (angle (P2 h) (P1 h) (P2 hc) (conj (sym not equal (Cond h)) H)) / (forall M, InAngleH (angle (P2 h) (P1 h) (P2 hc) (conj (sym not equal (Cond h)) H)) M -> same side P M (line of hline h)); hcong 4 unicity : forall a h P h1 h2 HH1 HH2. "Incid P (line_of_hline h) -> " BetH (V1 a) (V a) (V2 a) -> hline construction a h P h1 HH1 -> hline construction a h P h2 HH2 -> hEg h1 h2

The concept of "inside an angle" is not necessary + remove dependent types.

▲□▶ ▲圖▶ ▲国▶ ▲国▶ - 国 - のへ⊙

Betweenness

Tarski's betweenness is not strict:

Definition Bet A B C := BetH A B C \setminus A = B \setminus B = C.

Congruence

Hilbert's congruence tells nothing about degenerate segments:

Definition Cong A B C D :=
 (CongH A B C D /\ A <> B /\ C <> D) \/
 (A = B /\ C = D).

▲□▶ ▲圖▶ ▲国▶ ▲国▶ - 国 - のへ⊙

The not obvious axioms:

Five segments Formalization of Hilbert's book (Theorems 12, 14, 15, 16, 17, 18) + non trivial degenerate case Upper dimension Our own proof

Parallel postulate Previous work done in the context of Tarski's axioms

- We assume decidability of point equality and incidence.
- We do not assume decidability of intersection of line for the equivalence between the neutral geometries.

forall P l, Incid P l \/ ~ Incid P l; forall A B, A=B \/ ~ A=B;

Conclusion

Contributions

- We provide a formalization of Hilbert axioms with a formal proof that this version is correct and descriptively complete.
- The proof is about 5kloc of Coq.
- These results turn the GeoCoq library (a library about Tarski's geometry) into a library about foundations of geometry in general.

Conclusions

- Hilbert's axioms produce a lot of administrative work.
- It is better to keep the concepts of segments, rays and angles implicit.

Potential extensions

- Foundations based on group of transformations
- Generalization to nD

Braun-Boutry-Narboux (Unistra)
