A Domain-dependent Approach

Implementation and Experiments

Conclusions

Problem

In geometry, the nine-point **circle** is a circle that can be constructed for any given **triangle**. It is so named because it passes through nine significant concyclic points defined from the triangle. These nine points are:

- the **midpoint** of each side of the triangle;
- the **foot** of each altitude;
- the **midpoint** of the line segments from vertices of the triangle to the orthocenter (where the three altitudes meet; these line segments lie on their respective altitudes).

How to generate meaningful geometric keywords from images?

Retrieve Basic Geometric Information

➤ Recognized basic geometric entities:

14 points

6 lines

1 circle

➤ Recognized labels of geometric entities:

A, B, C, D, E, F, G, H, I, J, K, L, M

Retrieve Basic Geometric Information (cont.)

➤ Mined basic geometric relations:

12 incident(A, l)

9 pointOnC(A, o)

0 parallel(l_1 , l_2)

3 perpendicular(l_1 , l_2)

6 equal(distance(A, B), distance(C, D))

0 equal(size(angle(A, B, C)),
size(angle(D, E, F)))

Output

Points

G := (108,412), C := (484,384), B := (36,417), J := (103,336),
A := (82, 58), H := (48,329), I := (231,179), N := (176,299),
F := (261,401), K := (93,194), M := (294,360), E := (285,223),
L := (68,378), D := (61,231).

Lines

a := segment(B,C), b := segment(A,G), c := segment(H,C),
d := segment(A,C), e := segment(B, I), f := segment(B,A).

Circle

g := circle(N,133).

Output (cont.)

Relations

incident(G,a), incident(J,b), incident(J,c), incident(J,e),
incident(H,f), incident(I,d), incident(F,a), incident(K,b),
incident(M,c), incident(E,d), incident(L,e), incident(D,f),
pointOnC(G,g), pointOnC(H,g), pointOnC(I,g),
pointOnC(F,g), pointOnC(K,g), pointOnC(M,g),
pointOnC(E,g), pointOnC(L,g), pointOnC(D,g),
perpendicular(a,b), perpendicular(c,f), perpendicular(d,e),
equal(distance(C,F),distance(B,F)),
equal(distance(J,K),distance(A,K)),
equal(distance(C,M),distance(J,M)),
equal(distance(C,E),distance(A,E)),
equal(distance(B,L),distance(J,L)),
equal(distance(B,D),distance(A,D)).

Derive Advanced Geometric Information

midpoint, intersection, foot

triangle

concurrent

$\{D, E, F, K, L, M\}, \{J\}, \{G, H, I\}$

$\triangle ABC$

$\text{concurrent}(\text{segment}(A,G), \text{segment}(B,I), \text{segment}(C,H))$

Output

Type of Point

$C := (484,384)$, $B := (36,417)$, $A := (82,58)$, $N := (176,299)$,
 $F := \text{midpoint}(C,B)$, $K := \text{midpoint}(J,A)$, $M := \text{midpoint}(C,J)$,
 $E := \text{midpoint}(C,A)$, $L := \text{midpoint}(B,J)$, $D := \text{midpoint}(B,A)$,
 $J := \text{intersection}(b,c)$,
 $H := \text{foot}(c,\text{segment}(B,A))$, $I := \text{foot}(\text{segment}(A,C),e)$,
 $G := \text{foot}(\text{segment}(B,C),b)$.

Type of Line

$b := \text{halfline}(A,G)$, $c := \text{segment}(H,C)$, $e := \text{segment}(B,I)$,
 $h := \text{triangle}(A,B,C)$.

Type of Circle

$g := \text{circle}(N,133)$.

Relations

concurrent(b,c,e),

pointOnC(G,g), pointOnC(H,g), pointOnC(I,g),

pointOnC(F,g), pointOnC(K,g), pointOnC(M,g),

pointOnC(E,g), pointOnC(L,g), pointOnC(D,g).

Generate Geometric Keywords for Searching

Proper strategies are required to generate keywords for web searching, i.e., determining the sequence of classes of geometric information for keywords generation.

Keywords are weighted according to the levels and types of their corresponding geometric entities or relations (e.g., advanced > basic, entities > relations).

It is possible to design specific strategies according to one's own requirements.

Output

For the given image, four groups of keywords are generated:

1. {triangle, circle, closest, concurrent, midpoint}

2. {**triangle, circle, foot, concurrent, midpoint**}

3. {triangle, circle, closest, concurrent, bisect}

4. {triangle, circle, foot, concurrent, bisect}

In terms of "All"

triangle, circle, foot, concurrent, midpoint

Implementation and Experiments

Conclusions

Overview of the Domain-dependent Approach

Specify the Domain of Interest

 Identify a set of basic geometric concepts, including entities, quantities, and relations, and a set of advanced ones with formal representation.

Specify the Domain of Interest (cont.)

Basic Geometric Entities

Type	Representation	Meaning	Keywords
Point	(x,y)	a point with coordinates (x,y)	point
Line	line(A,B) <i>or</i> halfline(A,B) <i>or</i> segment(A,B)	a straight line <i>or</i> a halfline <i>or</i> a segment passing through two different points A and B	line <i>or</i> halfline <i>or</i> segment
Circle	circle(A,r) <i>or</i> circle(A,B) <i>or</i> circle(A,B,C)	a circle with center A and radius r <i>or</i> a circle with center A and passing through another point B <i>or</i> a circle passing through three different points A, B, C	circle

Specify the Domain of Interest (cont.)

Basic Geometric Quantities

Type	Representation	Meaning	Keywords
Distance	$\text{distance}(A,B)$	the distance between A and B where A and B are two points	distance
Angle	$\text{angle}(A,B,C)$	$\angle ABC$ where A, B, and C are three different points	angle
Size	$\text{size}(\alpha)$	the size of α where α is an angle	size

Specify the Domain of Interest (cont.)

Basic Geometric Relations

Type	Representation	Meaning	Keywords
Boolean	<code>incident(A,l)</code>	a point A lies on a line l	collinear, incident
Boolean	<code>pointOnC(A,o)</code>	a point A is on a circle o	incident
Boolean	<code>parallel(l₁,l₂)</code>	a line l ₁ is parallel to a line l ₂	parallel
Boolean	<code>perpendicular(l₁,l₂)</code>	a line l ₁ is perpendicular to a line l ₂	perpendicular
Boolean	<code>equal(distance(A,B),distance(C,D))</code>	the distance between two points A and B is equal to the distance between two points C and D	equidistant
Boolean	<code>equal(size(angle(A,B,C)),size(angle(D,E,F)))</code>	the size of $\angle ABC$ is equal to the size of $\angle DEF$	equal angle

Specify the Domain of Interest (cont.)

Advanced Geometric Entities

Name	Representation	Definition	Keywords
midpoint	$M := \text{midpoint}(A,B)$	$\text{midpoint}(A::\text{Point}, B::\text{Point}) \triangleq [M::\text{Point} \text{ where } \text{incident}(M, \text{line}(A,B)) \wedge \text{equal}(\text{distance}(M, A), \text{distance}(M, B))]$	midpoint, bisect
Triangle	$t := \text{triangle}(A,B,C)$	$\text{triangle}(A::\text{Point}, B::\text{Point}, C::\text{Point}) \triangleq [\{\text{segment}(A,B), \text{segment}(B,C), \text{segment}(C,A)\} \text{ where } \neg \text{incident}(A, \text{segment}(B,C))]$	triangle
Circumcircle	$c := \text{circumcircle}(t)$	$c := \text{circumcircle}(t::\text{Triangle}) \triangleq [\text{circumcircle}(O::\text{Point}, r::\text{Length}) \text{ where } t := \text{triangle}(A,B,C) \wedge \text{pointOnC}(A,c) \wedge \text{pointOnC}(B,c) \wedge \text{pointOnC}(C,c)]$	circumcircle
...

Specify the Geometric Domain (cont.)

Advanced Geometric Relations

Name	Representation	Definition	Keywords
Tangent	tangent(l,c)	tangent(l::Line,c::Circle) \triangleq [pointOnC(foot(center(c),l),c)]	tangent
Bisect	bisect(A,B,C,D)	bisect(A::Point,B::Point,C::Point,D::Point) \triangleq [equal(size(angle(A,B,D)), size(angle(C,B,D)))]	angle bisector
Trisect	trisect(A,B,C,D)	trisect(A::Point,B::Point,C::Point,D::Point, E::Point) \triangleq [equal(size(angle(A,B,D)), size(angle(D,B,E))) \wedge equal(size(angle(D,B,E)), size(angle(E,B,C)))]	trisector, trisect
Concurrent	concurrent(l ₁ ,l ₂ ,l ₃)	concurrent(l1::Line,l2::Line,l3::Line) \triangleq [incident(intersection(l1,l2),l3) \vee incident(intersection(l2,l3),l1) \vee incident(intersection(l1,l3),l2)]	concurrent

Retrieve Basic Geometric Information

Use shape recognition techniques (e.g., improved Hough transform, randomized detection algorithm) to detect geometric entities from the given image.

Use techniques of image matching (e.g., OCR Engines) to recognize labels of the detected entities.

Use numerical computation to mine geometric relations among the detected entities.

Derive Advanced Geometric Information

 For each geometric instance O , we introduce a property level (denoted as $O.level$), which is an integer in $[0, +\infty)$, to characterize the priority of O in the derivation process.

 Derive advanced geometric entities and relations in order from lower level to higher level according to their definitions.

Generate Keywords

Keywords of different levels are weighted for their influences on the characterization of the image, and

these keywords for geometric concepts are combined to generate several groups of keywords ordered according to their weights.

Overview

Illustrative Example

A Domain-dependent Approach

Implementation and Experiments

Conclusions

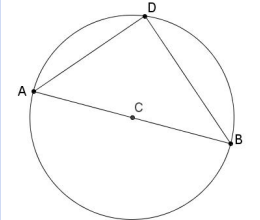

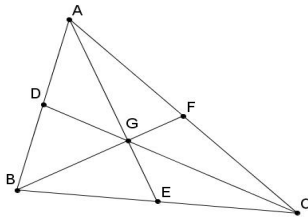

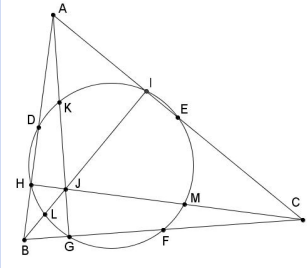

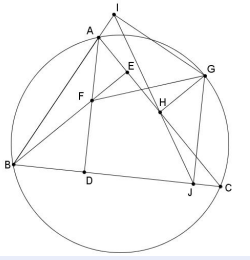

Implementation

- ❖ The techniques of keyword generation from an image of diagram described above have been implemented in C++ development environment.
- ❖ Diagram images used for our experiments were produced by using GeoGebra.

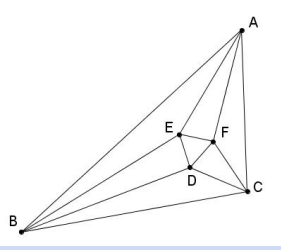

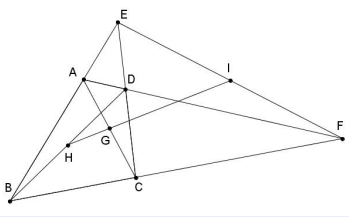

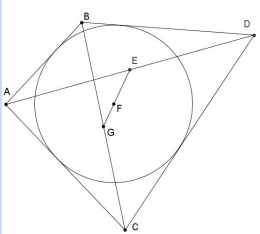

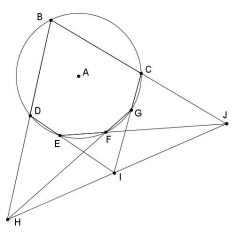

Experiments

No.	Image	Keywords
1		<p>{quadrilateral, circumcircle, closest/foot, midpoint/bisect}</p>
2		<p>{triangle, circumcircle, closest/foot, collinear/incident}</p>

13		{triangle, intersection, angle bisector, equidistant}
14		{polygon, intersection, collinear/incident, triangle}
15		{polygon, intersection, perpendicular, equidistant}

Overview of Experiments

- 

The search engine used in our experiments is Google.
- 

Among **40** examples, more than **50%** are encouraging, which indicates that the keywords generated are effective for searching.
- 

More experimental results will be performed in our future work.

Overview

Illustrative Example

A Domain-dependent Approach

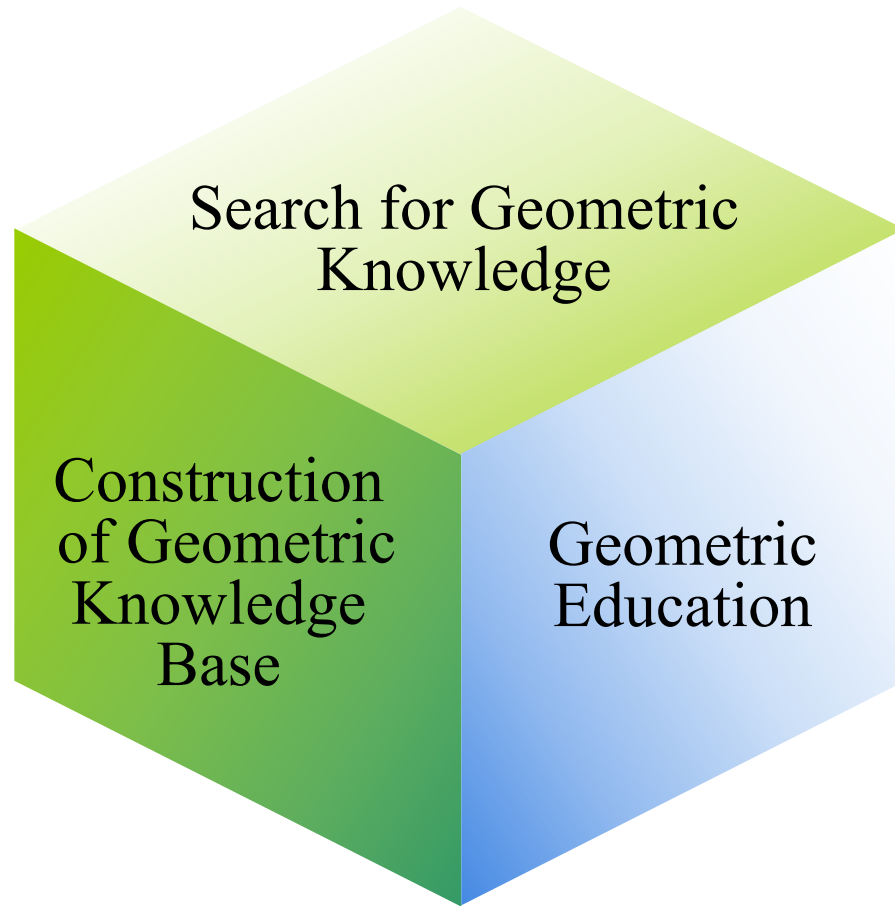

Implementation and Experiments

Conclusions

Applications

Conclusions

1

The presented approach can be used to search the web for geometric information, in particular geometric theorems, which a query image may imply.

2

The approach may be generalized for the generation of keywords in any other domain of interest from images in the domain.

3

The approach has a potential application in automated label generation for images.

Future Work

We are extending our work towards

1

discovering of mathematical concepts from image data,
and

2

automating the process of digitalizing the classic
mathematical literature with semantic representation.

Automated Generation of Keywords from
Images for Geometric Information Search

Thanks!
